

Flow for Cloud (frontend to backend)

Login Page:

username

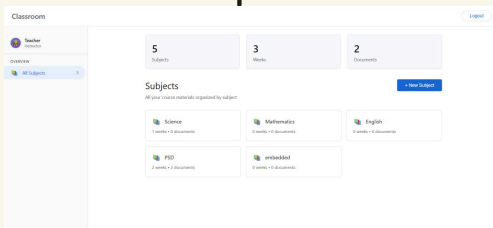

text

Sign in

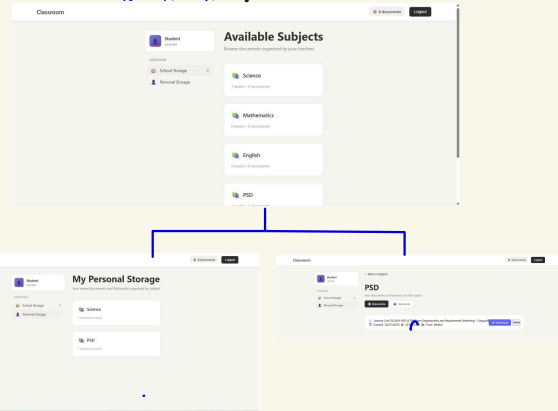

for backend side (left to do):

- need to store accounts for teacher & student
- probably need to have sign up page which gets info of the school they are from etc.

Teacher dashboard

Student dashboard

Flow:

- Teacher logs in from that school.
- Can add subjects
- Click on subject & then can add weeks
- Then each week, teacher can upload a document.

This is where the document will be stored in Fire store database

- Teacher can delete from document so probably should delete from db

Things left to do in backend side:

- Generating of document Id (connect to DB)
- Deleting document from DB
- Need to add subjects tied to each school in db so that when a student logs in from that school all the subjects will be loaded automatically, its hardcoded right now to be saved local storage

Flow:

- Student logs in, click on subject from their school storage, copies document over to personal.
- In personal, clicks on the subject where it holds their document
- Can click on whiteboard, this whiteboard will be tied to document to save state
- There is edit button for them to go into doc and edit
- Under each subject, there will be flashcards tab & flashcard decks under that.
- Student can delete doc

Things left to do in backend:

- Retrieve document Id from db to do edits & whiteboard
- Need to tie flashcards to each user and each subject
- Deleting document from db (maybe this is where storage bucket comes from?)

Database in firestore:

Users schema:

- email
- role
- school id

Schools:

- name
- storageBucketPrefix
- teachers ID

flashcardsSet:

- decks:
 - deck 1:
 - name
 - Subject tied to it
 - user tied to it
 - array of question & answer
 - deck 2

Documents

- document 1:
 - ownerID (user)
 - schoolID
 - storagePath (signed url?)
 - title
 - type
 - annotations (collection under a document)
 - content
 - coordinates
 - height
 - width
 - x
 - y
 - page number
 - whiteboards (collection under a document)
